

# Approach light mast systems

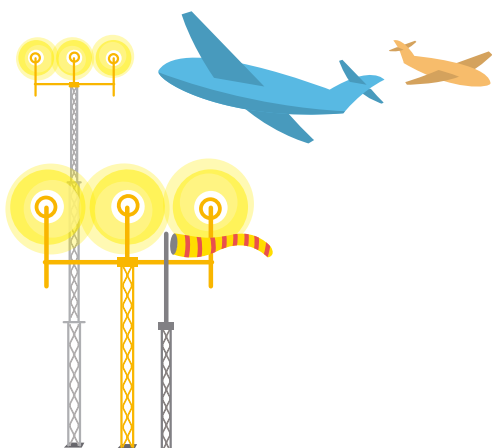

All Lattix Systems mast systems for the approach light support systems comply to the latest ICAO frangibility requirements.

All Lattix masts are rigidly full scale crash tested to withstand the forces of wind and extreme weather, and of course the jet blast that might occur on an airfield.

In addition, the Lattix® masts are fully frangible and will give way and absorb any force upon impact, leaving the airplane wing/body as little damaged as possible.

The Lattix approach light station systems are adapted to fit any instrumentation and lighting. The system is designed for easy access to instrumentation for maintenance purposes.

Systems available up to 16m.

# Lattix Systems has delivered frangible mast systems to more than 200 airports in 40 countries.

Approach light systems

Meteorological and weather station systems

Wind cone mast systems

Surveillance mast systems

Localizer support systems

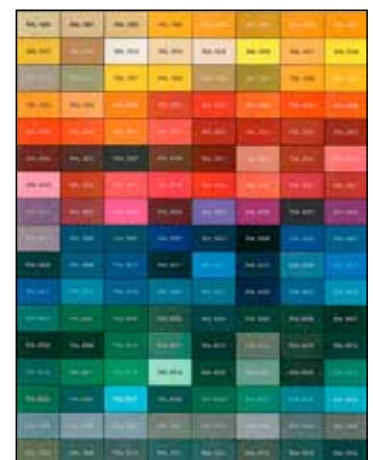

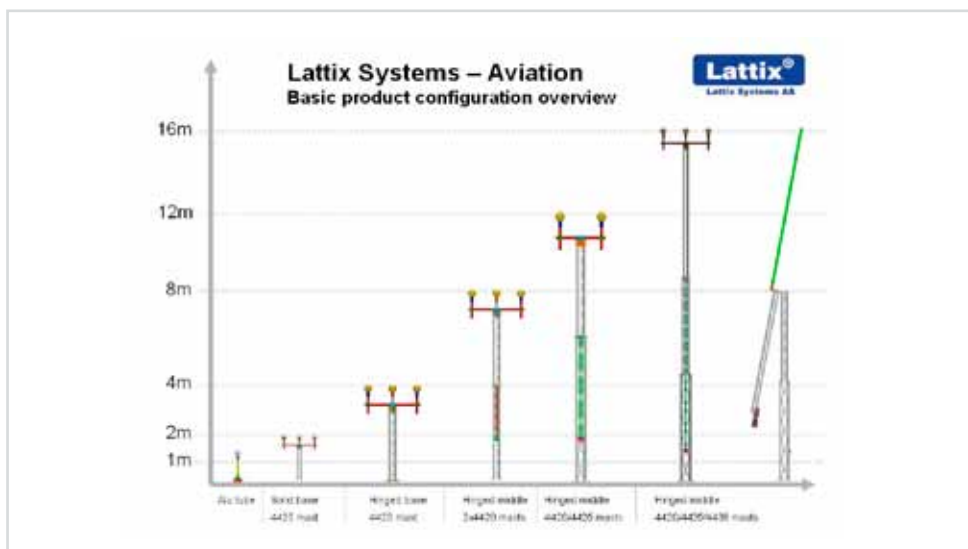

Glidepath mast systems

Floodlight systems

Extra tall masts

Lattix® masts can be powder coated according to all RAL colors.
